

What is a ceramic capacitor?

A capacitor is a passive electronic device that stores electric charge. Ceramic capacitors consist of two or more alternating layers of ceramic material as the dielectric and metal layers acting as the non-polarized electrodes. Applications include automotive, bypass, decoupling, filtering, RF, and ESD protection.

How is a 400 F capacitor charged?

A 400 uF capacitor is charged so that the voltage across its plates rises at a constant rate from 0 V to 4.0 V in 20 s. What current is being used to charge the capacitor? 5 u? 20 u? 40 u? 80 u? Q1. An electron moving with a constant speed enters a uniform magnetic field in a direction at right angles to the field.
