Battery environmental protection concept design case

How can EV battery design reduce the environmental impact?

Integrating principles such as second life, reconditioning, and comprehensive recycling strategies into battery design can significantly reduce the environmental impact of EVs over their entire lifecycle.

How can lithium-ion battery technology improve environmental impact?

By taking the environmental impact assessments from existing lithium-ion battery technology--it is possible to derive energy density, cycle life and % active material targets required to achieve equal or better environmental impacts for emerging technologies to use.

What happens at the end of the conceptual battery pack design process?

This marks the end of phase I of the conceptual battery pack design process. There are possibilities of multiple battery chemistries the end, depending on several factors of cell form factor and other cell types. This fact is the reason why further calculations are necessary to be performed based on the phase II of the process model.

What is life cycle assessment of battery pack design engineers?

With recent developments in the discipline of circular economy, Life Cycle Assessment (LCA) of LIBs becomes important. There are numerous studies on LCA of LIBs and this paper investigates the existing LCA results to quantify the different parameters that could affect the decisions of a battery pack design engineer.

How to design an EV battery pack?

The general design of the EV battery pack involves multi-disciplinary knowledge about materials, electrochemistry, electrics and electronics, thermal engineering and mechanical engineering. Incorporating the environmental dimension into the design of the EV battery pack will aggravate its complexity.

How can a designer check the environmental factors of a battery pack?

After further crossing down options depending on the weight requirement of the battery pack, the designer can check for the various other environmental factors which were based on the functional unit of per kg basis. The distinct factors of CED, GWP can be checked to finalize the chemistry for the requirements set by the designer.

Design Research Based on Environmental Protection Concept and Children's Environmental Education in Interactive Installation Art Fangxuan Cao(B) School of Art and Design, Beijing University of Technology, Beijing, China CaoFangXuan@emails.bjut .cn Abstract. In recent years, global environmental problems have become increas-

This analysis investigates the environmental impacts of the battery over its entire life cycle, using different sets of parameters to account for the uncertainty and variability of the ...

SOLAR PRO. Battery environmental protection concept design case

The challenges in the designing or selection of cells for a new battery pack are addressed by the concept design process model. As already established in Table 3, the new battery pack needs to have energy density higher than 220 Wh/kg and two different GWP parameters as an example reference point for the new design. As per the process model ...

The benefits of the new rocker panel design in terms of battery protection and lightweighting can be maximized when translat-ing the hybrid structural concept to other vehicle parts that can have an impact on the integrity of the battery units, such as the lower A and B pillars, the bumpers and the rear impact plate.

To protect the environment and reduce dependence on fossil fuels, the world is shifting towards electric vehicles (EVs) as a sustainable solution. The development of ...

An optimization design case of an EV battery pack for eco-design is conducted based on the proposed optimization framework, which provides the details of the optimization ...

DB ESG developed the initial SolidEdge design concepts for the battery raft structure based on point loads for the battery units, comparing the merits of the different design options. Design concepts were analysed by FEA and the ...

environmental protection materials in clothing design is discussed. The fi nal model "s classi fi cation accuracy has increased and the DCNN parameters are converging more quickly thanks to this

By taking the environmental impact assessments from existing lithium-ion battery technology--it is possible to derive energy density, cycle life and % active material ...

The first digit represents the degree of protection against the intrusion of solid objects, while the second digit represents the degree of protection against the intrusion of liquids. Seal design; Crash protection; Crush protection; Material selection - there are many different materials used in battery pack enclosures. Vibration Isolation ...

Life Cycle Assessment (LCA) is a systemic tool for evaluating the environmental impact related to goods and services. It includes technical surveys of all product life cycle stages, from material acquisition and manufacturing to use and end-of-life(Nordelöf et al., 2014).With regard to the battery, the LCA is one of the most effective ways of exploring the resource and ...
