

What are the chemical hazards in battery manufacturing?

Additional chemical hazards in battery manufacturing include possible exposure to toxic metals, such as antimony (stibine), arsenic (arsine), cadmium, mercury, nickel, selenium, silver, and zinc, and reactive chemicals, such as sulfuric acid, solvents, acids, caustic chemicals, and electrolytes.

Are your employees safe in the battery manufacturing industry?

The battery manufacturing industry is vital to many other industries, such as tech and automotive manufacturing. Ensuring employee safety is your responsibility, as the industry poses a high level of workplace risk.

What is the biggest hazard in the battery manufacturing industry?

Inorganic lead dust is the primary hazard in the battery manufacturing industry. Lead is a non-biodegradable, toxic heavy metal with no physiological benefit to humans. Battery manufacturing workers, construction workers, and metal miners are at the highest risk of exposure.

Is battery manufacturing an dangerous industry?

Battery manufacturing is a high-risk, hazardous industry. However, it doesn't mean that workers can't get home safe to their families at the end of the day. If you're ready to commit to keeping your employees safe, you need the right tools for the task. That's where we can help.

How can lithium-ion batteries prevent workplace hazards?

Whether manufacturing or using lithium-ion batteries, anticipating and designing out workplace hazards early in a process adoption or a process change is one of the best ways to prevent injuries and illnesses.

Are employers responsible for detecting a lead hazard in battery manufacturing?

Employers are responsible for detecting lead hazards in battery manufacturing, with certain exceptions. They are required to collect full-shift personal samples to monitor an employee's daily exposure to lead. Battery manufacturing is a high-risk, hazardous industry, but that doesn't mean that workers can't get home safe to their families at the end of the day.
