

What is a power inverter?

Power inverters, or simply 'inverters', are transformers that will convert a DC current into an AC current, allowing you to run higher voltage equipment from a battery or other DC power source.

How do I choose a battery inverter?

Ensure that the inverter matches your battery's voltage (typically 12V or 24V). Larger appliances or higher power consumption needs may require higher-capacity inverters and battery systems, such as 24V or even 48V setups. Power Consumption: Low (suitable for small devices like phone chargers and LED lights).

What type of battery does an inverter use?

Inverters can use a lot of DC current over a period of time. The best type of battery for an inverter to draw power from is therefore a deep cycle one. Lead acid types are designed to be repeatedly discharged down to about 50 per cent of their nominal capacity before being recharged.

How much power does an inverter use?

Typically these are in the range 100 watts (W) ideal for low powered items like phone chargers and laptops to 3,000W for a kettle or heater although this high output would drain the typical battery set-up in minutes, we will come on to this later. Inverters work by taking DC power and switching it on and off through a transformer.

Should I use an inverter to power USB chargers?

You can also see why it would be unwise to use an inverter to power USB chargers as these could be run directly from a 12V DC source and not suffer the energy loss in the conversion from DC, to AC and back to DC again.

Do you need a 240V inverter for a campervan?

In campervans and motorhomes, an inverter is essential for converting the 12V DC power from your battery into 240V AC power for running household appliances. This guide covers the critical factors in selecting the right inverter, and includes a list of common 240V appliances and the inverter sizes required to power them efficiently. 1.
