

Does fast charging lead to battery degradation?

The findings revealed no significant difference in battery capacity loss between vehicles that fast charged more than 90% of the time and those that did so less than 10%. These results suggest that frequent fast charging of an EV does not lead to notable battery degradation.

Does fast charging affect battery life?

Fast charging technology has advanced, ensuring that batteries can rapidly charge without significant degradation. While there may be slight differences in battery life when comparing fast charging with slower charging, these are not substantial enough to deter the use of DC fast chargers.

Does fast charging reduce battery capacity?

After 50,000 miles of driving, the vehicles exclusively charged with Level 2 chargers experienced around 24.5% battery capacity reduction; however, those charged with Level 3 DC chargers had a slightly higher capacity loss of 27%. These results indicate that fast charging may contribute to a somewhat higher rate of battery degradation.

Is fast charging bad for a car battery?

Data from Geotab shows that fast charging in hot conditions can accelerate battery degradation. Batteries face more resistance when charged from very low or nearly full states, which can contribute to degradation so avoid fast charging when your car battery is extremely hot, freezing cold, or at a high or low state of charge. Is fast charging bad for EV batteries?

Degrading batteries through frequent fast charging is a concern for new EV owners but there are a lot of factors that determine if it's bad for the battery or not. Welcome to The Switch, Euronews Next's new mobility series for people considering making the switch to an EV.

How to protect EV batteries during fast charging?

On balance, to further protect EV batteries during fast charging, you should try the following:

- o Precondition the battery in extreme weather before charging.
- o Avoid regularly charging to 100 per cent; aim for 80 per cent instead.
- o Balance fast charging with slower Level 2 charging when possible.
