

Are crystalline silicon solar cells still a critical material for photovoltaic devices?

In addition, these types of cells lead the industry and account for more than half of the market. For the foreseeable future, Si will still be a critical material for photovoltaic devices in the solar cell industry. In this paper, we discuss key issues, cell concepts, and the status of recent high-efficiency crystalline silicon solar cells.

What are crystalline silicon solar cells?

Crystalline silicon solar cells are today's main photovoltaic technology, enabling the production of electricity with minimal carbon emissions and at an unprecedented low cost. This Review discusses the recent evolution of this technology, the present status of research and industrial development, and the near-future perspectives.

How efficient are silicon solar cells in the photovoltaic sector?

The photovoltaic sector is now led by silicon solar cells because of their well-established technology and relatively high efficiency. Currently, industrially made silicon solar modules have an efficiency between 16% and 22% (Anon (2023b)).

What is crystalline silicon (c-Si) solar PV?

Volume 248, December 2022, 111976 With the goal of Net-Zero emissions, photovoltaic (PV) technology is rapidly developing and the global installation is increasing exponentially. Meanwhile, the world is coping with a surge in the number of end-of-life (EOL) solar PV panels, of which crystalline silicon (c-Si) PV panels are the main type.

Can crystalline silicon be recovered from photovoltaic modules?

[Google Scholar] Klugmann-Radziemska, E.; Ostrowski, P. Chemical treatment of crystalline silicon solar cells as a method of recovering pure silicon from photovoltaic modules. *Renew. Energy* 2010, 35, 1751-1759. [Google Scholar] [CrossRef]

Is crystalline silicon the future of solar technology?

Except for niche applications (which still constitute a lot of opportunities), the status of crystalline silicon shows that a solar technology needs to go over 22% module efficiency at a cost below US\$0.2 W⁻¹ within the next 5 years to be competitive on the mass market.

As a clean and efficient renewable energy source, solar energy has been rapidly applied worldwide. The growth rate of China's installed capacity ranks first in the world. However, the life span of photovoltaic (PV) modules is 25 to 30 years, and the rapid development of installed capacity indicates that a large number of PV modules will be decommissioned in the ...

CIGS and CdTe solar cell technologies rival crystalline solar cells, the recorded efficiency of CIGS and CdTe

solar cells are 23.6% and 22.3%, respectively. On the other ...

Over time, various types of solar cells have been built, each with unique materials and mechanisms. Silicon is predominantly used in the production of monocrystalline and polycrystalline solar cells (Anon, 2023a). The photovoltaic sector is now led by silicon solar cells because of their well-established technology and relatively high efficiency.

Existing PV LCAs are often based on outdated life cycle inventory (LCI) data. The two prominently used LCI sources are the Ecoinvent PV datasets [22], which reflect crystalline silicon PV module production in 2005, and the IEA PVPS 2015 datasets [3], which reflect crystalline silicon PV module production in 2011. Given the rapid reductions in energy ...

Although crystalline silicon (c-Si) panels continue to provide the highest investment return, several other PV technologies such as amorphous silicon, CdTe, Cu-In-Ga-Se (CIGS) thin film, organic, and hybrid cells have been proposed to lower panel manufacturing costs [2]. For the next 40 years, PV-based waste will be dominated by first-generation crystalline silicon modules, which ...

Dominated by crystalline silicon solar cells, photovoltaic industries have been developed to compete with other energy sources and renewable energy. For a reduction of solar module price per watt peak, there were many approaches to improve the conversion efficiency of solar cells without substantial cost increase.

Black-Si has textured surface, which can assist light trapping and improves efficiency of solar cells. Black-Si was first fabricated by Jansen et al. [3] in 1995, and it exhibits a characteristic black surface colour. This characteristic appearance is due to the micro- or nano-sized structures present on the surface of the b-Si, which contributes to high absorption and ...

With a global market share of about 90%, crystalline silicon is by far the most important photovoltaic technology today. This article reviews the dynamic field of crystalline silicon photovoltaics from a device-engineering perspective. First, it discusses key factors responsible for the success of the classic dopant-diffused silicon homojunction solar cell. Next it analyzes two ...

As of 2021, the c-Si PV modules accounted for 95 % of the market share [15]. As the photovoltaic industry progresses, a growing number of innovative solar panels are being deployed, including perovskite solar cells and dye-sensitized solar cells [16], [17]. The mining of silica results in the generation of silica dust, which can lead to the development of severe lung ...

Solar energy can be transformed to electricity using a range of technologies, but crystalline silicon (c-Si)-based PV technology dominates in the PV market due to the high efficiency, long-term stability, reliability, and second most abundant (27%) material.

This study can provide an efficient recycling process for valuable materials resourced from waste crystalline-silicon PV module, including Si in the PV cell, and Ag, Cu, Pb, Sn, in PV ribbon.
