

Does a low-power charger protect the battery

Can a lower wattage Charger keep up?

However,if your device has a larger battery or fast charging capabilities,a lower-wattage charger may not be able to keep upand you may not see the same charging speed as you would with a higher-wattage charger. Let's look at an example.

How does a low power charger work?

When a low-power device is connected,the charger or power bank automatically detects its power needs and switches to Low Current Mode,delivering a smaller current output tailored to the device's specifications. This prevents overcharging,overheating,and damage to the device's battery,ensuring safe and efficient charging.

Should I use a lower wattage charger for fast charging?

Using a lower-wattage charger for fast charging is not recommended,as it may not be able to deliver the required power to charge your device quickly. Fast charging requires a higher wattage charger,typically above 18W,to charge your device efficiently.

Can a low wattage Charger damage your device?

Using a charger with lower wattage is unlikely to damage your device,as long as it's a genuine charger that meets the necessary safety standards. However,using a low-quality or counterfeit charger can damage your device,regardless of its wattage. It's essential to use a charger from a reputable manufacturer to ensure your device's safety.

Can I use another Charger if I have a low wattage?

If you wanted to use another charger,it must have at least 18W of power output. If you use a charger that has a lower wattage,let's say 5W,you will see a slower charging time. Another example is,if you have a tablet like the iPad Pro,it has a battery of 9720 mAh,the charger that comes with the iPad Pro has a wattage of 18W.

Is it safe to use a higher wattage Charger?

While using a charger with lower wattage is generally safe,using a charger with higher wattage can be a different story. If you use a charger with higher wattage than the device's recommended wattage,it can cause damage to the device. The device's charging circuit may not be able to regulate the excess energy,leading to:

Your phone's hardware determines how much power can be taken in. Add in the size of your phone's battery, temperature and software -- some settings intentionally slow down charging to protect the battery -- and you have a complex process. Even the power source affects how power flows. For example, USB ports are like a trickling stream, while wall outlets are like fire hoses.

The STBC15 is a linear charger thin film battery with a maximum charging current of 40 mA. The device uses a CC/CV algorithm to charge the battery. Thanks to the ultra-low consumption architecture, the charger is suitable for low-capacity cells such as thin film batteries and can use low energy sources such as energy harvesters.
