

Could a low-temperature and solution-based doping method improve efficiency?

Now, a low-temperature and solution-based doping method relying on group-V chloride salts may lead to new paths for efficiency improvement. Cadmium telluride (CdTe), with its lowest levelized cost of energy, is the only photovoltaic technology that can compete with silicon in high-volume markets 1.

Does recombination improve perovskite solar cell performance?

Electrical Doping Regulation of Carrier Recombination Enhances the Perovskite Solar Cell Efficiency beyond 28% With the power conversion efficiency (PCE) of perovskite solar cells (PSCs) exceeding 26.7%, achieving further enhancements in device performance has become a key research focus.

Can group-V chloride salts improve the efficiency of CdTe solar cells?

The doping of CdTe solar cells with group-V elements can improve long-term stability of the devices yet the open-circuit voltage is limited. Now, a low-temperature and solution-based doping method relying on group-V chloride salts may lead to new paths for efficiency improvement.

Does electrical doping increase PCE?

Our results demonstrate that electrical doping can increase the PCE from 24.78% to $\geq 28\%$. In-depth theoretical analysis reveals that these improvements in performance are driven by the modulation of carrier recombination processes through doping, leading to significant increases in the open-circuit voltage and fill factor.

Which photovoltaic technology can compete with silicon?

Cadmium telluride (CdTe), with its lowest levelized cost of energy, is the only photovoltaic technology that can compete with silicon in high-volume markets 1. To achieve high device performance, CdTe is traditionally doped with copper (Cu).

Can perovskite solar cells improve power conversion efficiency?

This article has not yet been cited by other publications. With the power conversion efficiency (PCE) of perovskite solar cells (PSCs) exceeding 26.7%, achieving further enhancements in device performance has become a key research focus. Here, we investiga...

Nature Energy - The doping of CdTe solar cells with group-V elements can improve long-term stability of the devices yet the open-circuit voltage is limited. Now, a low ...

Solar cell technology has taken a significant leap with the introduction of silver-doping in kesterite (CZTSSe) thin-film solar cells.

Perovskite solar cells (PSCs) have significant potential for next-generation photovoltaic technology

applications. However, the instability of hole transport layers (HTLs) ...

Photovoltaic electricity generation is a rapidly growing industry, and a key pillar of a decarbonised energy system. In modern solar cells, laser technology is used to form localised structures ...

CdTe solar cell technology is one of the lowest-cost methods of generating electricity in the solar industry, benefiting from fast CdTe absorber deposition, CdCl₂ treatment ...

Solar cell also called photovoltaic (P V) cell is basically a technology that convert sunlight (photons) directly into electricity (voltage and electric current) at the atomic

Energy Technology. Early View 2401542. Review. Advancements in CdTe Thin-Film Solar Cells: Is Doping an Effective Strategy for Performance Enhancement? Ipsita ...

Novaled's doping technology offers many benefits that satisfy requests of OPV manufacturers: Covers rough electrodes to increase device yield ; Enables efficient charge transport and ...

P-type solar panels are the most commonly sold and popular type of modules in the market. A P-type solar cell is manufactured by using a positively doped (P-type) bulk c-Si ...

CdTe solar cells have relied for decades on copper, which creates limited hole density, stability issues and a ceiling for voltage and efficiency. Now, Metzger et al. ...

An international research group has developed a solar cell based on a lead-free perovskite material known as Cs₂AgBiBr₆. The cell's absorber was doped with trans ...
