Are lithium-ion batteries suitable for grid-scale energy storage?

The combination of these two factors is drawing the attention of investors toward lithium-ion grid-scale energy storage systems. We review the relevant metrics of a battery for grid-scale energy storage. A simple yet detailed explanation of the functions and the necessary characteristics of each component in a lithium-ion battery is provided.

What is a battery energy storage system?

A battery energy storage system (BESS) is an electrochemical device that charges (or collects energy) from the grid or a power plant and then discharges that energy at a later time to provide electricity or other grid services when needed.

Can batteries be used in grid-level energy storage systems?

In the electrical energy transformation process, the grid-level energy storage system plays an essential role in balancing power generation and utilization. Batteries have considerable potential for application to grid-level energy storage systems because of their rapid response, modularization, and flexible installation.

What are the different types of grid-scale batteries?

There are several different types of grid-scale batteries, and each has their own applications and specifications, including: Lithium-ion battery energy storage systems are the most common electrochemical battery and can store large amounts of energy. Examples of products on the market include the Tesla Megapack and Fluence Gridstack.

Are lithium phosphate batteries a good choice for grid-scale storage?

Based on cost and energy density considerations, lithium iron phosphate batteries, a subset of lithium-ion batteries, are still the preferred choice for grid-scale storage.

How many power supplies should a grid energy storage system have?

Generally, grid energy storage systems demand sufficient power and energy for their stable operation. To effectively drive the complex and wide-range devices in the grid, the number of power supplies should be large, in the order of hundreds and even thousands.

The right diagram of Figure 13.4 considers the distribution of energy consumption consisting of the fraction of directly used PV energy, energy taken from the battery and energy purchased from the grid. With such a system configuration the solar fraction of the energy consumption can reach values of ~80%; only ~20% have still to be delivered by the ...
