

How does solar power work?

Solar power works by converting energy from the sun into power. There are two forms of energy generated from the sun for our use - electricity and heat. Both are generated through the use of solar panels, which range in size from residential rooftops to 'solar farms' stretching over acres of rural land. Is solar power a clean energy source?

How does a solar PV system generate electricity?

Solar PV systems generate electricity by absorbing sunlight and using that light energy to create an electrical current. There are many photovoltaic cells within a single solar module, and the current created by all of the cells together adds up to enough electricity to help power your home.

Can solar panels generate electricity?

Yes, it can - solar power only requires some level of daylight in order to harness the sun's energy. That said, the rate at which solar panels generate electricity does vary depending on the amount of direct sunlight and the quality, size, number and location of panels in use.

What are solar panels used for?

Solar panels are used to produce electricity. They can be found on buildings but can also be used on a solar farm to harvest the power of the sun. Solar panels are made from lots of solar cells. Solar cells are put together to make a solar panel.

How are solar panels made?

Solar panels are made from lots of solar cells. Solar cells are put together to make a solar panel. Made from a material called silicon, solar cells convert the light from the sun into electricity. You can see an example of solar cells on the top of some calculators.
