

# How to control current and voltage of battery pack

What is a battery current control system?

The current control system is commanded by a superimposed battery voltage controller aimed at bringing the battery terminal voltage to the fully-charged state while also limiting the maximum battery charging current.

What is the EV battery connection system?

Inside the pack, the EV battery cell connection system combines individual cells in parallel and series configuration to create both energy and power for the pack, as well as providing critical sensor data to the Battery Management System (BMS) to control the pack functions.

Why should a battery pack be monitored?

Therefore the pack current, cell temperature, and each cell voltage should be monitored timely in case of some unusual situations. The battery pack must be protected against all these situations. Good measurement accuracy is always required, especially the cell voltage, pack current, and cell temperature.

Are battery charging control systems suitable for different battery types?

This paper presents the design of battery charging control system suitable for different battery types. A PI controller-based battery current control system is designed with the aim of achieving robust control system behavior over a wide range of battery internal resistance variations.

Why should you use a low current battery pack?

Lower current consumption saves more energy and gives longer storage time without over discharging the battery. This design focuses on e-bike or e-scooter battery pack applications and is also suitable for other high-cell applications, such as a mowing robot battery pack, 48-V family energy storage system battery packs, and so forth.

What is EV battery management system?

EV batteries experience substantially greater stress than traditional Internal Combustion Engine battery systems. In a typical Electric Vehicle, the battery pack may experience thousands of charge and discharge cycles throughout its life. The pack Battery Management System monitors voltage, current, and temperature of cells
