How do you remove a capacitor from a circuit board?

Press the tip of a heated soldering iron directly onto the solder joint on the back of the circuit board that is holding the old capacitor down. Hold on to the capacitor itself with your other hand. As the joint melts, you can feel the tip of the iron fall into the hole of the circuit board.

How do you desolder a capacitor?

Identify the capacitor to be desoldered. 3 Hold the capacitor by the middle with tweezers and gently touch one of its soldered ends with the tip of the soldering iron. Keep the tip there for two to three seconds, and then quickly move it to the other side of the capacitor and keep it there for two to three seconds.

How do I know if I need a replacement capacitor?

That subtle "popping-up" is exactly what you're looking for. Make a note of the polarity of the old capacitor, and mark the exact values you'll need for the replacement: capacitance and voltage/temperature ratings (these may be written on the part itself, or you can look up the part number).

What does a busted capacitor look like?

A busted capacitor can be obviously broken (leaking brownish fluid, corroded, or with the leads severed), but sometimes it's subtle. The top of a blown capacitor will be slightly bent outwards in a convex shape, rather than flat or slightly indented inwards like a working capacitor. See the photos above for examples.

What does a blown capacitor look like?

The top of a blown capacitor will be slightly bent outwards in a convex shape, rather than flat or slightly indented inwards like a working capacitor. See the photos above for examples. Think of it like a vacuum-sealed glass bottle. When the seal is intact, the bottle cap is flat, and when you break the seal, the bottle cap pops up.

Small capacitors won't do much harm, but large ones can cause serious injury. Safely discharge capacitors using a suitable resistor. Instructions. 1 Calculate the resistance required to discharge the capacitor from its working voltage. Use a resistor rated between 5 and 50 ohms for each 5 volts of the capacitor's working voltage.

wire the signal wires to the pots So this is one other thing that got me confused. I'm working with an import-type 5way switch. From what I gather, one side of the switch receive the hot wire from the pickups, and the other side receive the "output" of the tone controls, and I jump both commons of the switch to the
