

What is solar hydrogen peroxide?

Solar hydrogen peroxide ( $\text{H}_2\text{O}_2$ ) production has garnered increased research interest owing to its safety, cost-effectiveness, environmental friendliness, and sustainability. The synthesis of  $\text{H}_2\text{O}_2$  relies mainly on renewable resources such as water, oxygen, and solar energy, resulting in minimal waste.

How is hydrogen peroxide produced as a solar fuel?

Hydrogen peroxide was produced as a solar fuel from water and dioxygen using solar energy by combination of a water oxidation catalyst and a photocatalyst for two-electron reduction of  $\text{O}_2$  in acidic aqueous solutions.

How is hydrogen peroxide produced by solar-light-driven oxidation of water by dioxygen?

This review focuses on recent progress in production of hydrogen peroxide by solar-light-driven oxidation of water by dioxygen and its usage as a green oxidant and fuel. The photocatalytic production of hydrogen peroxide is made possible by combining the  $2e^-$  and  $4e^-$  oxidation of water with the  $2e^-$  reduction of dioxygen using solar energy.

What is solar-driven production of hydrogen peroxide?

Thus, solar-driven production of hydrogen peroxide mainly consists of the catalytic four-electron/four-proton oxidation of water and the catalytic two-electron/two-proton reduction of dioxygen. The overall reaction is the solar-driven oxidation of water by dioxygen to produce hydrogen peroxide.

Can solar energy be used to produce hydrogen peroxide ( $\text{H}_2\text{O}_2$ )?

Provided by the Springer Nature SharedIt content-sharing initiative The direct utilization of solar energy for the artificial photosynthesis of hydrogen peroxide ( $\text{H}_2\text{O}_2$ ) provides a reliable approach for producing this high-value green oxidant.

How do photocatalysts produce hydrogen peroxide?

The overall reaction is the solar-driven oxidation of water by dioxygen to produce hydrogen peroxide. Either or both the four-electron/four-proton or/and the two-electron/two-proton oxidation of water and the two-electron/two-proton reduction of dioxygen requires photocatalysts.

The conversion of solar energy into chemical energy or high-value chemicals has attracted considerable research interest in the context of the global energy crisis. Hydrogen ...

This review systematically explores bismuth vanadate ( $\text{BiVO}_4$ ) photocatalysts for solar-driven hydrogen peroxide ( $\text{H}_2\text{O}_2$ ) production through artificial photosynthesis. It discusses the ...

Solar energy can be utilized in photocatalysis technology to realize light-driven hydrogen peroxide ( $\text{H}_2\text{O}_2$ )

production, a green chemical synthesis route signing high-performance ...

Microbial solar cells (MSCs) that use biofilms produced in seawater can generate electricity from sunlight without additional fuel because the products of photosynthesis can be utilized as electrode reactants, whereas the ...

This review summarizes recent progress in catalyst design strategies for solar-driven H<sub>2</sub>O<sub>2</sub> production, including surface tailoring, defect engineering, structural ...

Among the various candidates, sustainable solar hydrogen (H<sub>2</sub>), which directly converts solar energy into chemical energy over photocatalytic semiconductor materials, can ...

This review focuses on the solar-driven production of hydrogen peroxide by means of two-electron/two-proton or/and four-electron/four-proton oxidation of water and two-electron/two-proton reduction of dioxygen.

So much to sea: Hydrogen peroxide can be produced from seawater and dioxygen by using solar energy. This article provides a focused review of recent developments ...

Safe, sustainable, and green production of hydrogen peroxide is an exciting proposition due to the role of hydrogen peroxide as a green oxidant and energy carrier for fuel cells. The current work reports the development of ...

The direct utilization of solar energy for the artificial photosynthesis of hydrogen peroxide (H<sub>2</sub>O<sub>2</sub>) provides a reliable approach for producing this high-value green oxidant. Here we report on ...

Hydrogen peroxide-modified SnO<sub>2</sub> as electron transport layer for perovskite solar cells with efficiency exceeding 22%. Author links open overlay panel Haibing Wang, ...
