Can a liquid cooling structure effectively manage the heat generated by a battery?

Discussion: The proposed liquid cooling structure design can effectively manage and disperse the heat generated by the battery. This method provides a new idea for the optimization of the energy efficiency of the hybrid power system. This paper provides a new way for the efficient thermal management of the automotive power battery.

What is battery liquid cooling heat dissipation structure?

The battery liquid cooling heat dissipation structure uses liquid, which carries away the heat generated by the battery through circulating flow, thereby achieving heat dissipation effect (Yi et al., 2022).

Does liquid cooled heat dissipation work for vehicle energy storage batteries?

To verify the effectiveness of the cooling function of the liquid cooled heat dissipation structure designed for vehicle energy storage batteries, it was applied to battery modules to analyze their heat dissipation efficiency.

Does lithium-ion battery thermal management use liquid-cooled BTMS?

Liquid cooling, due to its high thermal conductivity, is widely used in battery thermal management systems. This paper first introduces thermal management of lithium-ion batteries and liquid-cooled BTMS.

Why is a liquid cooling system important for a lithium-ion battery?

Coolant improvement The liquid cooling system has good conductivity, allowing the battery to operate in a suitable environment, which is important for ensuring the normal operation of the lithium-ion battery.

Does a lithium-ion battery pack have a temperature distribution?

De Vita et al. [10] proposed a computational modeling method to characterize the internal temperature distribution of a lithium-ion battery pack, which was used to simulate the liquid cooling strategy for thermal control of the battery pack in automotive applications, highlighting the advantages and disadvantages of the strategy.

The results indicate that by 292 s, the lowest temperature of the battery pack reaches 20 °C; following this, the temperature continues to increase due to the self-heating effect of the batteries. With liquid cooling deactivated, the battery pack's T_{max} reaches 30.8 °C by the end of the discharge cycle. These observations demonstrate that ...
