What happened at a lithium battery storage facility?

A fire broke out at this storage facility last Friday, sending towering flames and black smoke into the night sky and forcing the evacuation of about 1,500 people. The battery storage facility contains thousands of lithium batteries. These batteries store electricity from renewable energy sources like solar energy.

Is energy storage a risk?

But all forms of energy storage and generation have risk, he said. The situation is similar to battery fires in electric cars which happen much less frequently than gasoline fires. In fact, gasoline fires are so common the media seldom report them while they cover battery fires excessively. There is another consideration here.

Can a battery make a fire worse?

Yes. This is critical to understand. Once insulation systems are compromised, batteries of any chemistry can continue feeding energy into the fire, making it effectively inextinguishable until the batteries are fully drained. The only kind of battery that cannot make a fire worse is one that holds no energy.
