

Perovskite cells decompose when exposed to light

Does UV light degrade perovskite solar cells?

Although the power conversion efficiency of perovskite solar cells has increased from 3.81% to 22.1% in just 7 years, they still suffer from stability issues, as they degrade upon exposure to moisture, UV light, heat, and bias voltage. We herein examined the degradation of perovskite solar cells in the presence of UV light alone.

Does white light decompose perovskite?

The perovskite decomposition under white light illumination is explored under ultrahigh vacuum conditions. In-situ compositional analysis reveals the perovskite decomposition with the appearance of metallic Pb. A light-induced degradation mechanism is proposed. Perovskite is photosensitive, and a light-induced degradation mechanism is proposed. 1.

How does light affect the degradation of a perovskite?

However, even in the absence of TiO_2 and/or UV-light, the combined action of molecular oxygen and light also induces a rapid degradation of organic-inorganic perovskites. Bryant et al. found that $\text{CH}_3\text{NH}_3\text{PbI}_3$ underwent a complete degradation to PbI_2 under a continuous illumination over 48 h in dry air [14].

How does UV exposure affect perovskite decomposition?

With increasing UV exposure time, the ratio between the PbI_2 (12.6%) and $\text{CH}_3\text{NH}_3\text{PbI}_3$ (14.1%) peaks increased and this means $\text{CH}_3\text{NH}_3\text{PbI}_3$ perovskite decomposing to PbI_2 continuously 34, 44, 45. Figure 3 and Table 1 show multiple light I-V measurements acquired during 1,000 h UV exposure under open circuit conditions.
