Which control methods are used in battery charging?

Control methods commonly used in battery charging are: constant current (CC), constant voltage (CV), two-step charging (i.e., CC-CV), pulse charging (PC), reflex charging or negative pulse charging (NPC), trickle charge or taper-current (TC), and float charge (FC) [28, 29, 30, 31]. 2.1. Constant Current (CC)

What is the relationship between charging voltage and battery charging current limit?

The relationship between the charging voltage and the battery charging current limit can be expressed by the formula: Charging voltage = OCV + (R I x Battery charging current limit) Here, R I is considered as 0.2 Ohm.

Why do we need a constant-current-constant-voltage battery control method?

Therefore, it causes an early replacement. Development of control methods seeks battery protection and a longer life expectancy, thus the constant-current-constant-voltage method is mostly used. However, several studies show that charging time can be reduced by using fuzzy logic control or model predictive control.

What are the benefits of a battery control method?

Development of control methods seeks battery protection and a longer life expectancy, thus the constant-current-constant-voltage method is mostly used. However, several studies show that charging time can be reduced by using fuzzy logic control or model predictive control. Another benefit is temperature control.

Why are battery cell voltage equalizations important?

Unbalanced battery cell voltages can reduce storage capacities and may cause explosions or fires in the worst case which is a major obstacle for safe and optimum operations of battery-driven appliances, such as EVs. Therefore, battery cell voltage equalizations have become an important research topic.

Which control method is used for charging and discharging lead-acid batteries?

**Results and Discussion** This research shows that the most used control method for charging and discharging lead-acid batteries in renewable energy systems with battery energy storage is that of CC-CV. However, this control method requires a long time to charge the battery.
