How do mobile energy-storage systems improve power grid security?

Multiple requests from the same IP address are counted as one view. In the high-renewable penetrated power grid, mobile energy-storage systems (MESSs) enhance power grids' security and economic operation by using their flexible spatiotemporal energy scheduling ability.

Can mobile energy storage support the power grid?

Several MESS demonstration projects around the world have validated its ability to support multiple aspects of the power grid. This subsection describes the scheduling of mobile energy storage in terms of theoretical approaches and demonstration applications, respectively.

How does mobile energy storage improve distribution system resilience?

Mobile energy storage increases distribution system resilience by mitigating outages that would likely follow a severe weather event or a natural disaster. This decreases the amount of customer demand that is not met during the outage and shortens the duration of the outage for supported customers.

What is mobile energy storage?

In addition to microgrid support, mobile energy storage can be used to transport energy from an available energy resource to the outage area if the outage is not widespread. A MESS can move outside the affected area, charge, and then travel back to deliver energy to a microgrid.

What are the development directions for mobile energy storage technologies?

Development directions in mobile energy storage technologies are envisioned. Carbon neutrality calls for renewable energies, and the efficient use of renewable energies requires energy storage mediums that enable the storage of excess energy and reuse after spatiotemporal reallocation.

How can mobile energy resources improve power grid resilience?

Mobile energy resources, specifically MESSs, can increase power grid resilience by restoring power to critical loads following a contingency. Their mobility allows for increased flexibility compared to stationary DERs. MESSs can also provide ancillary services during normal operation, recouping investment decisions,

The development of modern society has continuously increased the power supply capacity requirements of the power grid and the personalized power demand of users. The traditional method of using diesel generators has problems such as low efficiency and exhaust gas pollution. In the context of the national "3060" policy, mobile energy storage systems can be widely used ...

With the rapid development of the national economy and urbanization, higher reliability is more necessary for the urban power distribution system [1], [2]. As a typical spatial-temporal flexible resource, mobile energy storage (MES) provides emergency power supply in the blackout [3], which can shorten the outage time, decrease the outage loss, and ...

In the past few decades, electricity production depended on fossil fuels due to their reliability and efficiency [1]. Fossil fuels have many effects on the environment and directly affect the economy as their prices increase continuously due to their consumption which is assumed to double in 2050 and three times by 2100 [6] g. 1 shows the current global ...

While stationary energy storage has been widely adopted, there is growing interest in vehicle-mounted mobile energy storage due to its mobility and flexibility. This article proposes an integrated approach that combines stationary and vehicle-mounted mobile energy storage to optimize power system safety and stability under the conditions of limiting the total ...

Under the "dual carbon" goal, accelerating the promotion of new energy generation to replace traditional fossil energy generation and building a new power system dominated by new energy has become the main direction for the development of China's power system []. However, with the continuous increase in the penetration rate of new energy, the ...
