

Are Si/C composites a good anode material for lithium-ion batteries?

Si/C composites exhibit not only acceptable faradaic yield at the first cycle, but also large capacity and good rechargeability. These are essential and highly desirable properties making Si/C composites worth considering for use as anode material within lithium-ion batteries.

Can silicon be used as anode material for Li-ion batteries?

In the past decade, silicon has been extensively studied as anode material for Li-ion batteries because of its extremely high specific capacity. However, the dramatic volume change and troublesome SEI (solid electrolyte interface) issues during lithiation and delithiation hinder the commercialisation of Si anode materials.

What is silicon carbide (Si/C) composite?

Silicon Carbide (Si/C) composites are a semi conductive material where silicon is highly dispersed within a carbon matrix. Si/C composites exhibit not only acceptable faradaic yield at the first cycle, but also large capacity and good rechargeability.

Is silicon-carbon composite anode material for high performance lithium-ion batteries?

Sohn, H., Kim, D.H., Yi, R., et al.: Semimicro-size agglomerate structured silicon-carbon composite as an anode material for high performance lithium-ion batteries. J. Power Sources 334, 128-136 (2016)

Is silicon a good material for lithium ion batteries?

The authors declare no conflict of interest. Silicon offers a theoretical specific capacity of up to 4200 mAh g⁻¹, positioning it as one of the most promising materials for next-generation lithium-ion batteries (LIBs). However, during lithium...

Does carbon coating influence silicon anode of lithium-ion batteries?

A well-defined silicon nanocone-carbon structure for demonstrating exclusive influences of carbon coating on silicon anode of lithium-ion batteries. ACS Appl. Mater. Interfaces 9, 2806-2814 (2017) Wang, B., Qiu, T., Li, X., et al.: Synergistically engineered self-standing silicon/carbon composite arrays as high performance lithium battery anodes.

Searching for alternative high-performance anodes for LIBs has been emphasized. Silicon carbide (SiC) nanomaterials, a wide bandgap semiconductor with ...

Herein, we develop a new kind of CPCM by introducing a binary thermal conductive skeleton of silicon carbide (SiC)/EG. Because of the mature production technology, SiC is a low-cost and industrially available semiconductor presenting comparable thermal conductivity but much higher electrical resistivity compared with EG [32], [33], [34].

Nowadays, research aimed at the development of materials with increased energy density for lithium-ion batteries are carried out all over the world. Composite anode materials based on Si and C ultrafine particles are ...

[52-56] Silicon-carbon composites surpass typical silicon-based anode materials regarding gram capacity, initial charge efficiency, and technology; however, side ...

6 ???· Revealed the preparation mechanism of a-Si materials. The prepared a-Si@C composite material showed excellent long-term cycle stability as an anode for lithium-ion batteries, with a capacity retention rate of greater than 88.8 % after 1200 cycles at a 0.5 A/g rate. Download: Download high-res image (357KB) Download: Download full-size image

To solve this problem, a lot of research has been done on silicon-based materials like silicon oxy carbide (SiOC) as hosts for LIB anodes. ... Surfactant-based selective assembly approach for Si-embedded silicon oxycarbide composite materials in lithium-ion batteries. Chem. Eng. J., 401 (2020), Article 126091, 10.1016/j.cej.2020.126091.

Mechanofusion has been highlighted for its ability to integrate silicon with carbon materials, showing the potential for further optimization. In light of these ...

Additionally, the continuous growth of the SEI layer reduces the battery's cycle life. Silicon Composite. One promising approach to developing a stable, high-capacity anode is to leverage the stability of graphite and combine it with the ...

Silicon Carbide (Si/C) composites are a semi conductive material where silicon is highly dispersed within a carbon matrix. Si/C composites exhibit not only acceptable faradaic yield at the first cycle, but also large ...

There is an urgent need to explore novel anode materials for lithium-ion batteries. Silicon (Si), the second-largest element outside of Earth, has an exceptionally high specific capacity (3579 mAh g⁻¹), regarded as an excellent choice for the anode material in high-capacity lithium-ion batteries. However, it is low intrinsic conductivity and ...

The demand for high-energy lithium-ion batteries (LIBs) has been rising exponentially. Silicon (Si) is gaining increased attention and popularity as an anode material due to its high theoretical capacity (4200 mAhg⁻¹, Li 4.4 Si) and ample abundance, but the huge volume expansion of Si restricts its use in practical applications. Herein, we propose a ...
