

What makes a good solar absorber?

An ideal solar absorber should provide high absorption, be ultra-wideband, and be insensitive to polarization and incident angles, which brings challenges to research. In this paper, we proposed and optimized an ultra-wideband solar absorber based on Ti-Al<sub>2</sub>O<sub>3</sub> cross elliptical disk arrays to obtain the ultra-wideband absorption of solar energy.

What makes a good solar absorber based on Ti-Al<sub>2</sub>O<sub>3</sub> elliptical disk arrays?

An ideal solar absorber should provide high absorption, be ultra-wideband, and be insensitive to polarization and incident angles, which brings challenges to research. In this paper, we proposed and optimized an ultra-wideband solar absorber based on Ti-Al<sub>2</sub>O<sub>3</sub> cross elliptical disk arrays to obtain the ultra-wideband absorption of solar energy.

What is a solar selective absorber?

Solar selective absorbers (SSAs) possess high sunlight absorption (300-2500 nm) and low infrared thermal radiative losses (2.5-25  $\mu$ m), which are undoubtedly the best choice for photothermal conversion process, and SSAs have been widely used in concentrating solar power, solar water heating, and solar drying.

What can a solar absorber be used for?

The current solar absorber in the new design can be generated for the multi-solar purposes of water heating, lighting, ventilation, charging for electronic devices, and electric vehicle transportation. The data used to support the findings of this study are included in the article.

What is the difference between a solar absorber and an IR absorber?

In the IR range of 2.5-30  $\mu$ m, both show high reflectance, corresponding to a low absorption. In other words, both designed absorbers achieve selective absorption of the solar spectrum.

Does a high absorptivity absorber use solar energy?

In order to verify the utilization effect of our high absorptivity absorber on solar energy, we used the AM1.5 solar radiation spectrum to simulate the lighting conditions of the real environment, and calculated the performance of the proposed absorber in the actual situation.

One way is building special micro-nanostructure of the device to increase the absorption and secondary use of photons. For example, gradient structure ...

A tandem device comprises two or more junctions of photoactive materials, each of which absorbs different regions of the incident solar spectrum, thereby maximizing the overall absorption. The top cells have a relatively larger bandgap than the underlying cells, which makes it feasible for the bottom cells to absorb in a higher wavelength range.

The cermet absorber shows a solar radiation absorption of 96.5% in the ultraviolet, visible, and near-infrared bands of sunlight (300-2500 nm). To further improve the solar ...

mean light absorption efficiency close to 98%, compared to 63% of planar Silicon Wafer. Key words: solar panels, light absorption, texturization, anti-reflective coating INTRODUCTION With more than 80% of global primary energy coming from fossil fuels, the world faces an impending threat to energy security in near future.

The LFMA exhibits higher solar light absorption and gets a broader absorption bandwidth than many other state-of-the-art solar metamaterial absorbers. In addition, the ...

In this paper, we utilize Ti and InAs materials to design a device capable of perfect solar absorption and high thermal emission efficiency. This structure is capable of generating surface plasmon resonance (SPR) and ...

To further improve solar absorption by reducing reflectance within the solar spectrum, an anti-reflection layer of  $\text{Si}_3\text{N}_4$  was employed, ... is widely used as a thermal insulation layer for solar-driven interfacial evaporation devices since it has a low thermal conductivity. In the following experiments, 10 g L<sup>-1</sup> NaCl solution is used to ...

Aerogel/film composites with asymmetric structures have outstanding potential for multifunctional applications of absorption-dominated electromagnetic interference (EMI) shielding and solar-driven interfacial evaporation. In this work, the double-layered aerogel/film composites are fabricated by stacking magnetic multi-walled carbon nanotubes/chitosan ...

How does Anti-Reflective Coating improve Solar Cell Performance? An increase in the amount of light absorbed by a solar cell is facilitated by its anti-reflective coating. A ...

It has been shown that the engineered interfacial solar evaporators using the two aforementioned aspects can double the light-to-heat conversion efficiency, increasing pure ...

To address this, we present a GaAs thin-film solar cell incorporating an ARC layer for enhanced light-trapping and optimized photon absorption. In addition, we integrate carrier-selective contacts using titanium dioxide ( $\text{TiO}_2$ ) as the electron transport layer and molybdenum oxide ( $\text{MoO}_3$ ) as the hole transport layer, ensuring effective charge separation and collection.
