

## Solid-state battery negative electrode material carbon

Are hard carbons a good negative electrode material for Na-ion batteries?

Hard carbons are promising negative electrode materials for Na-ion batteries (SIBs), and the process of (de)insertion of Na<sup>+</sup> ions into/from hard carbons has attracted much attention in recent research.

Can a negative electrode material be used for Li-ion batteries?

We have developed a method which is adaptable and straightforward for the production of a negative electrode material based on Si/carbon nanotube (Si/CNTs) composite for Li-ion batteries.

Which material is used as a negative electrode for lithium ion and Na-ion batteries?

For evaluating the electrochemical performance of the materials as negative electrode for Li-ion and Na-ion batteries, two-electrode Swagelok half-cells were assembled with the tested material acting as the working electrode (WE) and Li or Na metal disks were used as the counter electrode (CE).

Do silicon negative electrodes increase the energy density of lithium-ion batteries?

Silicon negative electrodes dramatically increase the energy density of lithium-ion batteries (LIBs), but there are still many challenges in their practical application due to the limited cycle performance of conventional liquid electrolyte systems.

Can CNT composite be used as a negative electrode in Li ion battery?

The performance of the synthesized composite as an active negative electrode material in Li ion battery has been studied. It has been shown through SEM as well as impedance analyses that the enhancement of charge transfer resistance, after 100 cycles, becomes limited due to the presence of CNT network in the Si-decorated CNT composite.

Which carbon is a negative electrode in a graphite Lib?

Before addressing the solvent co-intercalation issue in graphite, disordered carbons (e.g., soft and hard carbons) were the first candidates tested as the anode or negative electrode in LIBs. Those efforts indeed resulted in the commercialization of the 1<sup>st</sup> generation LIBs by Sony with Coke-derived soft carbon (SC) as the negative electrode.

To achieve higher energy density of the all-solid-state battery, negative electrode materials with high capacity are required. Carbon materials such as graphite (theoretical capacity: 372 mA h g<sup>-1</sup>) are commonly used as a negative electrode material for lithium secondary batteries [2]. However, higher capacity alternatives are being actively ...

In our study, we explored the use of Si<sub>3</sub>N<sub>4</sub> as an anode material for all-solid-state lithium-ion battery configuration, with lithium borohydride as the solid electrolyte and Li foil as the counter-electrode. Through

galvanostatic charge/discharge profiling, we achieved a remarkable maximum reversible capacity of 832 mAh/g.

Composite cathodes in SSBs are generally composed of CAM and SE particles in combination with polymer binders and carbon-based additives, which improve the ...

The Si negative electrode is the most promising candidate for next-generation lithium-ion batteries; it has a high energy density because of its high theoretical capacity of 4200 mA h g<sup>-1</sup> [[1], [2], [3]] particular, all-solid-state lithium-ion batteries (ASSLIBs), which comprise solid electrolytes (SEs) and employ Si negative electrodes, are expected to be useful in ...

Here, authors developed a Nb<sub>1.60</sub>Ti<sub>0.32</sub>W<sub>0.08</sub>O<sub>5-d</sub> negative electrode for ASSBs, which improves fast-charging capability and cycle stability.

1 ??&#0183; Solid-state batteries (SSBs) could offer improved energy density and safety, but the evolution and degradation of electrode materials and interfaces within SSBs are distinct from conventional batteries with liquid electrolytes and represent a barrier to performance ...

Silicon holds a great promise for next generation lithium-ion battery negative electrode. However, drastic volume expansion and huge mechanical stress lead to poor cyclic stability, which has been one of the ...

Potential vs. capacity profile for the first cycle of hard carbon prepared by pyrolysis of sugar when tested against sodium metal counter electrodes at C/10 in 1M NaClO<sub>4</sub> in ...

In the search for high-energy density Li-ion batteries, there are two battery components that must be optimized: cathode and anode. Currently available cathode materials for Li-ion batteries, such as LiNi<sub>1/3</sub>Mn<sub>1/3</sub>Co<sub>1/3</sub>O<sub>2</sub> (NMC) or LiNi<sub>0.8</sub>Co<sub>0.8</sub>Al<sub>0.05</sub>O<sub>2</sub> (NCA) can provide practical specific capacity values (C<sub>sp</sub>) of 170-200 mAh g<sup>-1</sup>, which produces ...
