

Is Switzerland able to store energy?

The global challenge is not only to produce more energy from renewable sources, but also to be able to store it. With its hydroelectric power plants in the Alps and innovative projects, Switzerland is contributing to the search for solutions for the efficient, long-term storage of electricity.

What is a containerized energy storage system?

A Containerized Energy Storage System (CESS) operates on a mechanism that involves the collection, storage, and distribution of electric power. The primary purpose of this system is to store electricity, often produced from renewable resources like solar or wind power, and release it when necessary. To achieve this, the

How does Switzerland contribute to the future of electricity storage?

With its hydroelectric power plants in the Alps and innovative projects, Switzerland is contributing to the search for solutions for the efficient, long-term storage of electricity. A journalist from Ticino resident in Bern, I write on scientific and social issues with reports, articles, interviews and analysis.

Why is Switzerland taking part in battery 2030?

Switzerland is taking part in the European research initiative Battery 2030, which aims to improve the longevity and energy density of conventional lithium-ion batteries so that fewer rare metals are used. Stationary systems that can stockpile renewable energy are also set for massive expansion in the coming decades.

What makes TLS energy's Bess containers different from standard containers?

Unlike standard containers, TLS Energy's BESS containers are equipped with essential components such as HVAC systems, fire fighting systems, and efficient lighting. This integration ensures that the containers are not just storage units but fully functional systems capable of handling diverse environmental conditions and safety

How does Swiss Energy Vault work?

The Swiss start-up Energy Vault follows the same principle as pumping and turbines. But instead of water, it uses concrete blocks. When there is a surplus of green electricity, these "bricks" are hoisted on top of each other to form a 120-metre tower. They are then "dropped" using gravity to generate electricity.
