ENERGY RESOURCES Distributed generation Behind-the-meter batteries Smart charging electric vehicles Demand Power-to-heat response This brief provides an overview of an innovative business model: aggregators. An aggregator can operate many distributed energy resources (DERs) together, creating a sizeable capacity similar to that of a conventional

When considering investing in a storage solution, several options exist, including lead acid or lithium ion batteries, redox-flow, molten salts, Compressed Air Energy Storage (CAES), and hydro storage. To decide which solution best suits a need, the technologies should be assessed against several criteria: energy production required

However, one of the best economic feasibility results of both business models is shown in scenario 3, which corresponds to an AA-CAES technology using a pre-existing salt cavern from the Monte Real / Carriço case study. The results of this third scenario make it suitable for RES storage business models and energy arbitrage business models.

Combined with the energy storage application scenarios of big data industrial parks, the collaborative modes among different entities are sorted out based on the zero-carbon target path, and the maximum economic value of the energy storage business model is brought into play through certain collaborative measures.

Currently, financial leasing is the most common business model for SESS, the mode of which is illustrated in Figure 1. As the leaser, users have the right to use the SESS to meet their energy needs by paying the SESS
