## The distance between capacitor and low voltage capacitor cabinet

What if a capacitor has zero capacitance?

You would expect a zero capacitance then. If the capacitor is charged to a certain voltage the two plates hold charge carriers of opposite charge. Opposite charges attract each other, creating an electric field, and the attraction is stronger the closer they are.

Does a capacitor have loss in terms of electric resistance?

A capacitor does not have lossin terms or electric resistance between the plates. However, if you bring those plates close enough, very little voltage is required to let the electrons start to jump from one plate to the other.

## How does distance affect a capacitor?

As Capacitance C = q/V,C varies with q if V remains the same (connected to a fixed potential elec source). So,with decreased distance q increases, and so C increases. Remember, that for any parallel plate capacitor V is not affected by distance, because: V = W/q (work done per unit charge in bringing it from on plate to the other) and W = F x d

What size capacitor should a cable be?

Go back to capacitors installation options ? Current standards for capacitors are defined so that capacitors can withstand a permanent overcurrent of 30%. These standards also permit a maximum tolerance of 10% on the nominal capacitance. Cables must therefore the sized at least for: Icable = 1.3 & #215; 1.1(Inominal capacitor)

How does distance affect a parallel plate capacitor?

Remember,that for any parallel plate capacitor V is not affected by distance,because: V = W/q (work done per unit charge in bringing it from on plate to the other) and W = F x d and F = q x E so, V = F x d /q = q x E x d/qV = E x d So,if d (distance) bet plates increases,E (electric field strength) would drecrese and V would remain the same.

What happens if a capacitor is charged to a certain voltage?

If the capacitor is charged to a certain voltage the two plates hold charge carriers of opposite charge. Opposite charges attract each other, creating an electric field, and the attraction is stronger the closer they are. If the distance becomes too large the charges don't feel each other's presence anymore; the electric field is too weak.
