What is a customizable electrochemical energy storage device?

A customizable electrochemical energy storage device is a key component for the realization of next-generation wearable and biointegrated electronics. This Perspective begins with a brief introduction of the drive for customizable electrochemical energy storage devices.

Which energy storage systems are applied to wearable electronic devices?

The energy storage systems applied to wearable electronic devices in this review are categorized into two groups: water-based systems and organic-based systems. Water-based systems include SCs, ZIBs, and metal-air batteries, while organic-based systems consist of LIBs, LSBs, SIBs, and PIBs.

Why do we need electrochemical energy storage devices?

With the increasing exhaustion of the traditional fossil energy and ongoing enhanced awareness of environment protection, research works on electrochemical energy storage (EES) devices have been indispensable.

What is an electrolyte based energy storage device (EES)?

An electrolyte with selective and facile transport of the common ion is an essential component of the EES device. This common energy storage design in batteries and fuel cells uses solid, liquid, and gaseous forms of reactants. Battery technology has gained attention, due to its modularity and low cost than other electricity storage options.

Which energy storage devices are used in electric ground vehicles?

The primary energy-storage devices used in electric ground vehicles are batteries. Electrochemical capacitors, which have higher power densities than batteries, are options for use in electric and fuel cell vehicles.

How can energy be stored and used?

Smaller units of energy can be easily stored and used in the form of electrochemical energy storage (EES) devices by end-users. Larger volumes of energy can be stored in mechanical, electromagnetic and/or chemical forms of energy (hydrogen, organic fuels), and these require a significant infrastructure commitment.
