

What type of capacitors do old radios use?

⋮ Your old tube radio uses four types of capacitors: variable (tuning) capacitors, mica capacitors, paper capacitors and electrolytic (filter) capacitors. When you restore an antique radio you will replace the paper and electrolytic capacitors, but not the variable capacitors. Mica capacitors seldom need replacement.

Do you need to replace a capacitor in a radio or TV?

In a professional overhaul, it is common to replace all of a set's large electrolytic capacitors and small paper capacitors. This article explains how to do that. Often, this "recapping" is all that the radio or TV needs to be restored to health. Incidentally, tubes are much more reliable than capacitors. Many tubes will last for decades.

Do vintage amplifiers have capacitors?

In vintage amplifiers, capacitors are often found in power supplies and the signal path, playing a critical role in the sound quality and stability of the system. The problem with capacitors, especially those made decades ago, is that they degrade over time.

Does a vintage tube radio need a capacitor?

Your vintage tube radio needs both direct current (DC) and alternating currents (AC) to operate. Capacitors act to pass AC while blocking DC. Capacitors are used to block, pass, filter and tune the various currents in your radio. Don't let terminology confuse you....."condenser" is just an old fashioned name for "capacitor".

What is an electrolytic capacitor?

Electrolytic capacitors are often referred to as "filter capacitors". Electrolytic capacitors help to convert (filter) AC (alternating current) power into the DC (direct current) voltage that your radio tubes need to operate. Size wise, the electrolytics are the largest capacitors.

Can old capacitors be replaced?

It's one thing to swap old caps with modern replacements, but what about electronics where the components are not hidden away, and are an important part of the equipment's look? [lens42] shares a method for replacing antique can-style capacitors in a way that leaves them looking completely original.

I've almost always got good results by replacing old capacitors with new exotic, or well recommended capacitors (look for recommendations on diyaudio or audioasylum). Changing capacitors changes the sound of the gear and sometimes you might end up with something you don't like and have to revert or try something different.
