How is electricity generated using solar?

Solar power works by converting energy from the sun into power. There are two forms of energy generated from the sun for our use - electricity and heat. Solar is an important part of NESO's ambition to run the grid carbon zero by 2025.

How does solar power work?

Solar power works by converting energy from the sun into power. There are two forms of energy generated from the sun for our use - electricity and heat. Solar is an important part of NESO's ambition to run the grid carbon zero by 2025. But how does solar power work, how much does the UK produce and what happens to solar on a cloudy day?

How the sun can be used to generate electricity?

Find out how the sun can be used to generate electricity. Electricity is generated from energy from the Sun by solar panels. These are made up from individual solar cells (also called photovoltaic cells). Light from the sun passes through the glass cover of a solar cell.

Where does solar energy come from?

Solar energy is derived from the sun, which emits an enormous amount of energy continuously. This energy travels through space and reaches the Earth, where it can be harnessed for various uses. Most commonly, solar energy is captured and converted into electricity using solar cells.

Do solar panels generate electricity at night?

Solar panels generate no electricity at night time. Solar panels can't store energy, so you have to use the electricity they generate when the sun is shining. You need batteries to store the energy generated. These are expensive. - Solar cells convert the light from the sun into electricity.

How does a solar power grid work?

An electric grid with lots of solar power must pair it with other technologies for reliability: energy sources like hydropower that can be powered up and down at will, energy storage (like batteries) to save up solar energy when it's plentiful, and/or long-distance transmission to move electricity from the sunniest spots to where it's needed.

**Solar Power Reduces Grid Stress.** When you go solar, you help reduce the amount of electricity that needs to be moved across transmission and distribution lines. Solar energy lowers the stress on the electricity grid because ...
